

Highlights

Extreme's Wired Access Solution for the Mainstream Enterprise

- **Always-on** – Best-in-class high-availability solution, hot-swappable unit replacement within a Stackable Chassis solution with integrated power redundancy.
- **Convergence-ready** – Support for PoE / PoE+, optimized for high-definition video surveillance, true plug and play capabilities for communications, collaboration, and engagement deployments, advanced QoS capabilities.
- **Energy efficient** – On average 36% more energy efficient than competitive solutions,¹ energy saver functionality further reduces power consumption for both Switch and IP Phone without losing telephony connectivity.
- **Powerful** – Wire-speed performance, true pay-as-you-grow Stackable Chassis capabilities, delivering up to 400 ports and 384 Gbps of virtual backplane throughput.
- **More Secure** – Standards-based 802.1X with integration with Extreme's Identity Engines portfolio for centralized, policy-based authenticated network access.
- **Flexible** – Best-in-class stacking capabilities; PoE and PoE+ and optional 1GbE and 10GbE SFP+ uplinks.
- **Fabric-ready** – Support for Extreme Fabric Connect services as part of Extreme's SDN-Fx strategy.

Ethernet Routing Switch 4000

Intelligent Stackable Chassis solution delivering performance, scalability, resilience, and flexibility.

Product Overview

The Extreme Networks Ethernet Routing Switch 4000 Series is a Stackable Chassis system providing high-performance, convergence-ready and resilient Ethernet switching connectivity. Available as a range of models supporting 10/100/1000 switching and routing, Power-over-Ethernet, Power-over-Ethernet+ and 10 Gigabit Ethernet uplink options, the Ethernet Routing Switch 4000 Series is ideally suited for mainstream Wiring Closet and other network Edge deployments.

The Ethernet Routing Switch 4000 Series provides resilient Stacking Chassis, Layer 2 switching and dynamic Layer 3 routing, plus many industry leading convergence features. This enables the Ethernet Routing Switch 4000 Series to deliver the scalability and resiliency required by today's application-driven enterprise networks while reducing total operational costs.

The Extreme Fabric Attach Auto-Attach Technology

Extreme has developed a standards-based capability – Fabric Attach – that facilitates the automatic attachment (“auto- attach” in standards verbiage) of end-point devices. Businesses can leverage Fabric Attach to dynamically deploy end-points, temporarily extending unique networking services to the edge as required. Auto-attached end-point devices connect to the appropriate network resources: this would typically be a Fabric Connect Virtual Service Network (VSN), or it could be a conventional VLAN. The Fabric Attach capability delivers the “Enabled Edge”, a foundational tenet of the Extreme SDN Fx architecture.

Fabric Attach is designed to streamline the deployment of generic IT end-point devices, networking devices, compute resources, and business-centric Internet of Things (IoT) end-point devices. In its simplest form, Fabric Attach facilitates the assignment of these devices to the correct network segment, where necessary extending segment presence to the edge node only for the duration of active, valid sessions. Fabric Attach can also deliver enhanced service differentiation through the implementation of granular business-driven policy.

Fabric Attach has been submitted to the IETF for consideration as a standard¹, and in collaboration with Wind River, Extreme has contributed Fabric Attach to the Open vSwitch open source development project².

Delivering Performance, Scalability, Resilience, and Flexibility

No one knows stacking like Extreme. Extreme introduced our first Stackable Chassis product in 1998 and have been perfecting the technology ever since. We were the first and only vendor to break the Terabit boundary with our ERS 5600 Series products and we've differentiated ourselves in the industry by ensuring that our Stackable Chassis perform like a traditional modular chassis implementation. We offer genuine chassis-like features including true pay-as-you-grow scaling and in service maintenance and restoration. From a management perspective, our Stackable Chassis looks like a single network entity – utilizing only a single IP address to dramatically simplify software upgrades. We also offer true investment protection with the ability to mix-and-match any units within the ERS 4000 Series into a Stackable Chassis.

High-Performance Architecture with True Pay-As-You-Grow Scaling

Our Stackable Chassis products combine non-blocking internal switching fabrics with a high-speed virtual backplane architecture to deliver a high performance solution that scales proportionally as new Switches are added. The ERS 4000 Series scales up to 384Gbps of virtual backplane throughput by simply cabling together up to 8 units. Adding a new unit to the Stackable Chassis is as easy as cabling in a new member then extending the appropriate configuration. The necessary software images and the configuration file are automatically downloaded to the new unit and then brought on-line without any user intervention.

To ensure wire-speed performance, our Stackable Chassis architecture is based on a shortest-path algorithm for optimal data flow across the system. Unlike competitive solutions that use unwieldy logical ring or token technology, Extreme's solution allows traffic to flow upstream and downstream simultaneously from every switch connected to the virtual backplane, optimizing performance, resiliency, and resource utilization. Extreme has an additional advantage in that we honor Quality-of-Service settings as traffic passes over the stacking connections – providing applications with optimal performance, and a positive end user experience.

All ERS 4000 models come with two in-built Stackable Chassis interfaces for simple, cost-effective and efficient connectivity. Unlike comparative offerings which daisy chain low-speed interfaces, Extreme's design frees uplink ports for dedicated connectivity to the backbone. In addition, a dedicated return cable is also used to protect against any port, unit or cable failures.

In-Service Maintenance and Restoration

Virtual hot swap capabilities ensure that a failure in any unit of the Stackable Chassis is quickly and easily rectified. Pioneered in modular switches, virtual hot swap is available in Extreme's Stackable Chassis solutions enabling immediate like-for-like unit replacement without any impact to the existing traffic or any units. If a failure occurs, neighboring Switches automatically wrap their fabric connections to help ensure that other Switches within the Stackable Chassis are not impacted. The failed unit is simply disconnected from the virtual backplane and, without pre-staging of software or configuration, a like-for-like unit is inserted, cabled, and powered-up. The AUR process automatically downloads software and configuration information to the new, replacement Switch, bringing it online, all without the need for a engineer intervention.

Further complementing the Stackable Chassis architecture, the Extreme ERS 4000 Series supports standards-based 802.3ad Link Aggregation as well as Extreme's own Multi-Link Trunking technology that allows grouping of ports to form high-speed trunks/aggregations. These bundles or groups of ports can be distributed across different units in the same Stackable Chassis, delivering higher levels of resilience in case of link or Switch failure to help ensure that traffic gets to its destination.

Distributed real-time monitoring of the Stackable Chassis provides an at-a-glance view of operational status and health which further enhances operational and management simplicity.

Centralized Management

From a management perspective, our Stackable Chassis appears as a single networking entity – utilizing only a single IP Address. This can significantly reduce the number of networking entities to be managed; up to 8 Switches can be managed just as easily as a single device. All Switches in a Stackable Chassis configuration utilize the same software load, and this image needs to be loaded only to the base unit of the Stackable Chassis which automatically loads it to other Switches.

Flexible Options

It's possible to mix and match any member of the ERS 4000 Series into a single Stackable Chassis. This allows customers to create the best mix of ports based on their specific requirements. The ERS 4000 Series can scale up to 8 units and 400 ports with up to 384Gbps of virtual backplane bandwidth.

Highlights of Extreme's Stackable Chassis Technology

True Pay-As-You-Grow Scaling

Extending capacity is easy. Simply cable a new unit into the virtual backplane and the configuration is automatically updated.

Scalable Performance

The high-performance design of Extreme's Switches along with their high-speed interfaces (up to 384Gbps) helps ensure that the Stackable Chassis scales proportionally as each new unit is added.

Optimal Path Forwarding

The shortest, most optimal path is chosen for each flow of traffic with QoS being maintained across the virtual backplane.

No Single Point-Of-Failure

Stackable Chassis operations are unaffected by the failure of any individual unit and units can easily be replaced within minutes.

Centralized Management

Single IP address for the entire Stackable Chassis for simplified management.

Flexible Stacking Options

Mix-and-match any member of the ERS 4000 Series into a single Stackable Chassis.

Figure 1: ERS 4000 Stackable Chassis

Convergence-Ready for Unified Communications, High-Definition Video, and More

For businesses looking to consolidate all forms of communication – voice, video and data – on a single infrastructure, the Extreme ERS 4000 Series delivers functionality that simplifies convergence of these technologies.

PoE/PoE+ to Power Your Converged Devices

Through support for both the IEEE 802.3af PoE and 802.3at PoE+ standards, ERS 4000 products are able to power IP Phones, Wireless Access Points, networked high-definition CCTV Cameras and other devices. This eliminates the need for separate power supplies for each unit, enabling reduced cabling and management costs for adds, moves, or changes.

Customers have the flexibility of products that support both PoE and PoE+. Having PoE+ support gives customers investment protection even though the driver for higher power usage is not present in many of the end devices typically being used.

Plug-and-Play for IP Phones

One of the main benefits offered by the ERS 4000 Series is plug and play support for IP Phones enabled through a combination of IEEE 802.1AB Link Layer Discovery Protocol (LLDP) and Extreme's Auto Discovery and Auto Configuration (ADAC) capability.

With these features enabled the ERS 4000 can automatically provision end devices such as IP Phones for simplified deployments and moves. The ERS 4000 dynamically applies the correct VLAN and QoS to both the IP Phone and the attached edge port. When the Phone is moved to another location, the configuration is automatically updated. In addition, QoS is automatically

provisioned on the ERS 4000 uplink so that voice is given top priority from the Wiring Closet to the network Core. These features save network operators time and can dramatically reduce the likelihood of a provisioning error during a large IP phone deployment.

The ERS 4000 also learns the identification, configuration, and capabilities of neighboring devices and provides these details to the network management system. This enables the system to have the most up-to-date physical view of the network so that communication configuration mismatches are detected and corrected quickly.

Sophisticated QoS Capabilities

The ERS 4000 Series delivers unsurpassed control for networks supporting a wide range of different application types. The ERS 4000 classifies, prioritizes and marks LAN IP traffic using up to eight hardware queues (2 strict priority and 6 weighted round robin) on every port – including our Stackable Chassis ports.

Classification can be done based on MAC address, IP ToS/DSCP marking, IP source /destination address or subnets, TCP/UDP source/destination port/port range, IEEE 802.1p user priority bits, ingress source port, IP Protocol ID (e.g., TCP, UDP, IGMP), EtherType (e.g., IP, IPX) or the IEEE 802.1Q VLAN ID. Comprehensive traffic policing and traffic shaping are also supported.

Most importantly we make QoS management intuitive through the use of Enterprise Policy Manager.2 By centralizing QoS management, Enterprise Policy Manager can reduce thousands of CLI or web transactions to a few simple actions through intuitive workflows.

Always-On Networking

In the era of 24/7 business operation, providing always-on access to applications is of the utmost importance. A pioneer in this area, Extreme provides cost-effective, resilient campus solutions for any size enterprise - from very large to very small.

Multi-Link and Distributed Trunking

The ERS 4000 Series supports 802.3ad Link Aggregation Groups as well as its own Multi-Link and Distributed Multi-Link Trunking implementations. Groups of links between the ERS 4000 and another device can be aggregated to enhance bandwidth and resiliency through active redundant links. Additionally, trunked ports can span multiple units of a Stackable Chassis enabling fail-safe connectivity to mission-critical servers and the network core.

Figure 2: Integrated field replaceable AC power supplies for ERS 4800 models

Distributed Multi-Link Trunking

802.3ad Link Aggregation Groups can be combined with Switch Clustering (leveraging Extreme's Split Multi-Link Trunking technology) on our Core products (VSP 9000 Series, VSP 8000 Series, and ERS 8800 Series). This creates a self-healing network that maximizes reliability and availability. Because all ports remain active, multiple connections to the Core enable customers to double their network bandwidth without incurring additional cost.

Virtual Router Redundancy Protocol

The ERS 4000 Series supports the Virtual Router Redundancy protocol. This feature enables automatic assignment of available IP Routers to participating hosts which increases the availability and reliability of routing paths via automatic default gateway selections on an IP sub network.

Detection of Link Failures and Loops

The ERS 4000 Series support a number of features that help detect and prevent link failures and loops. Extreme's Virtual Link Aggregation Control Protocol (VLACP) detects end-to-end failures by propagating link status between ports that are logically connected point-to-point across an intermediate network.

For loop detection, the ERS 4000 supports Simple Loop Prevention Protocol (SLLP) Guard. This feature extends Extreme's loop prevention mechanism of SLPP to the edge of the network for improved network resiliency. SLPP-guard operates in conjunction with SLPP in the network core or distribution layer and is designed to detect unusual loop scenarios which are not detected by other methods such as Spanning Tree. SLPP-guard immediately detects loops and disables affected ports according to the configured timer. All SLPP-guard actions are logged via Syslog and SNMP traps so that the cause of the loop can be diagnosed accurately.

Resilient Power Support

The ERS 4800 models (both PoE/PoE+ and non-power enabled) support field replaceable AC power supplies for improved redundancy and uptime. This power supply design offers N+1 power redundancy and/or supplementary PoE/PoE+ power budget, saving valuable rack space and enabling reduced system, servicing and sparring costs. Non-PoE+ models such as the ERS 4826GTS and the ERS 4850GTS utilize two 300 Watt Power Supply Units for redundancy while the PoE/PoE+ devices, ERS 4826GTS-PWR+ and ERS 4850GTS-PWR+ utilize two 1000 Watt Power Supply Units for redundancy.

Extreme Fabric Connect to the Wiring Closet

All ERS 4800 models support Extreme Fabric Connect enabling Fabric services to be extended from the Data Center all the way to the campus edge wiring closet. Based on an enhanced implementation of Shortest Path Bridging, an open, standards-based³ and extensible Fabric technology, Extreme Fabric Connect delivers an array of network services while providing a consistent enterprise-wide virtualization architecture that is simpler, more adaptive and reliable. With support on the ERS 4800, Fabric services are delivered on a campus-grade stackable access switch and can be extended much closer to where applications and users actually connect to the network. The result is simplified provisioning of applications or services at a point much closer to their entry into the network – eliminating complex hop-by-hop configuration and improving overall network resiliency.

Achieve Your Green IT initiatives

Energy efficient by design

New regulations and rising awareness of the ever-increasing cost of electrical power keep energy efficiency top of mind. An innovator in this area, Extreme has built energy efficiency into many of its hardware products. In fact, independent testing indicates that Extreme LAN Switches, Call Servers, Gateways, Unified Messaging Servers and Gigabit IP Phones are typically more energy-efficient than competitive equipment. The ERS 4000 Series, for example, was found on average to be 36% more energy efficient than competitive solutions from Cisco, HP, and Juniper.⁴ Because most Ethernet Switches operate 24/7, a 36% reduction in energy use goes a long way toward reducing yearly total cost of ownership.

Power Management Solution that Keeps All Connected Devices Operational

Building on our energy efficient design, Extreme offers true power management capabilities on ERS 4000 Series switches with our Extreme Energy Saver feature. Extreme Energy Saver aligns consumption of energy with attributes such as building occupancy. Much like a lighting control system, it essentially “dims” energy consumption during off-peak periods.

PoE and PoE+ enabled devices can increase energy conservation because, when IP phones are connected to a PoE or PoE+ port, power consumption by the IP phone is reduced when the network is in dimmed operation mode. When an Extreme IP Phone is connected to the ERS 4000 and Extreme Energy Saver is active, the Switch sends a proprietary 802.1AB TLV message to the phone that places the phone in maximum power conservation mode. Unlike some competitive solutions that actually disable the IP Phone by turning ports off, IP Phones remain operational when in power conservation mode.

Energy conservation by ERS 4000 Series Switches and the IP Phones connected to them can reduce total cost of ownership while helping IT managers achieve their “Green IT” initiatives.

Energy Analysis

Extreme Energy Saver can be embedded within the Extreme Enterprise Policy Manager² to provide centralized management of power consumption across all devices and endpoints. Network operators can perform energy analysis that not only shows peak energy usage and trending but also calculates real energy savings in terms of dollars and cents. A dashboard through which IT managers can drill down to specific ports and adjust ERS 4000 port speeds, as required, is also available.

Helping Secure Access at the Edge

The Ethernet Routing Switch 4000 enhances network security with authenticated network access that leverages IEEE 802.1X (Extensible Authentication Protocol (EAP) with extensions or devices MAC Address. Integration into Extreme's Identity Engines portfolio for centralized, policy-based access control is included along with management enabled through features such as Secure Shell (SSH), Secure Sockets Layer (SSL), Simple Network Management Protocol (SNMPv3), IP Manager List, Remote Authentication Dial-In User Service (RADIUS), and TACACS+ authentication. The ERS 4000 Series also offers numerous features that help prevent direct Denial of Service Attacks.

Authenticated Network Access

The ERS 4000 offers a wide range of flexible security options to help limit LAN access only to authorized personnel. Through IEEE 802.1X-based EAP client or device MAC Address, network administrators control authentication and authorization for access to network resources. Ethernet Routing Switch 4000 Series can support authentication of multiple devices/users on a single port.

For example, if a user's PC connects into the network via an IP Phone, the PC and the IP Phone can be independently authenticated on the same port. And, if your company has visiting users, guest VLAN support allows non-authenticated users to use the network with access to predefined guest resources only, such as Internet access. ERS 4000 Series also allows configuration of different servers to handle different RADIUS/ 802.1X functions.

When advanced, policy-based and centralized user/device authentication is required, the ERS 4000 Series can be used in conjunction with the innovative Extreme Identity Engines portfolio solution. This easy-to-deploy, policy-based solution assigns network access rights and permissions based on user role, where the user connects (local or remote) and how the user connects (Wired or Wireless). In this way, each connected device and user are known and are governed by device-specific security policies. For example, based on her network credentials, an employee using a corporate owned device will be granted full corporate access however, while using a non-corporate-owned device, she will be granted limited access.

As the number of employee-owned devices increases, Identity Engines can help network operators retain control and, by running device health checks and verifying user and device credentials, Identity Engines helps ensure that network access permission levels are enforced and adhered to without undue effort on the part of the IT staff.

Management

The ERS 4000 Series supports Secure Shell (SSHv2) for strong authentication and encrypted communication and SSL, which is supported on our web-based Enterprise Device Manager. SNMPv3 provides user authentication and data encryption for configuration and monitoring while IP Manager List limits access to ERS 4000 management features via a list of IP Addresses or IP ranges/subnets, providing greater security and manageability.

Mitigating Risk of Directed Attacks

Through advanced security services, the ERS 4000 Series actively help protect against malicious network attacks including increased protection from snooping of DHCP services, verification and filtering of ARP traffic via in-hardware processing (Dynamic ARP inspection), restriction of IP traffic to registered end devices (IP Source Guard), and control of Spanning Tree BPDU flow within the network (BPDU Filtering). Also supported, MAC Security and Static MAC address assignment have the ability to disable MAC learning if required.

The ERS 4000 supports advanced packet classification and deep packet filtering of up to 128 bytes, helping block unwanted network traffic while forwarding mission-critical traffic efficiently.

Additionally, the ERS 4000 Series supports a number of IPv6-specific "first-hop" security features, including: DHCPv6 Guard, Router Advertisement Guard, Neighbor Unreachability Detection (NUD) filtering, Duplicate Address Detection (DAD) filtering, and Dynamic IPv6 Neighbor Solicitation/Advertisement Inspection.

The ERS 4000 supports PCI 2.0 compliance and, as per the PCI 2.0 specification, authentication and logging takes place and can be captured and reported to help mitigate any security risk of shared maintenance accounts.

Consumerized IT

The move to "consumerized" IT has been described as penetration of the corporate network by employee-purchased mobile devices like iPhone, iPad, and Android phones. Whereas at one time employees had, at most, one device connecting to the corporate network, that number is expected to grow to 3, even 4 devices. Extreme Identity Engines helps network operators manage level of network access for this increasing number of devices by running device health checks and by verifying credentials of both user and device. Cost effective and easy to use, Extreme Identity Engines works in a multivendor environment.

Simplified Network Management

Creating a flexible operational environment, the ERS 4000 Series can be managed by a variety of management tools:

- Highly intuitive industry-aligned Command Line Interface (CLI) that eases the transition from one vendor to another.
- GUI and Web-based, Enterprise Device Manager (EDM) is an element management tool that enables quick, easy configuration changes to a single device through a pictorial view of that device using either HTTP or HTTPS (Secure Web).
- SNMP-based management (SNMP v1, 2 and 3) that provides an alternative standards based management approach and an interface for Configuration and Orchestration Manager.
- A wide array of Extreme management platforms that can be chosen based on the tasks the customer wishes to perform and the size of their environment.

These platforms include:

- **Configuration and Orchestration Manager (COM)** - Simplifies multi-element configuration via wizards and templates and provides network discovery, device backup, audits configuration changes, and bulk configuration management.
- **Enterprise Device Manager** - Simple on-switch GUI-based interface enabling simple device based provisioning.
- **Virtualization Performance and Fault Manager (VPFM)** - Monitors and audits network performance, provides discovery and inventory, and troubleshoots network issues, which can minimize events and reduce network downtime. VPFM supports multi-vendor environments and proactive monitoring, helping to identify issues before they affect the network.
- **Enterprise Policy Manager (EPM)** - Enables end-to-end policy provisioning to optimize network performance, define QoS filters, and deploy traffic and security filtering.
- **IP Flow Manager (IPFM)** - Provides insight into network utilization, top applications, peak usage, and traffic patterns to help diagnose problems at the network and application level through use of standards-based IPFIX.

Lifetime Warranty

Extreme includes industry-leading warranty services for our portfolio of Stackable Chassis Switches, including Extreme ERS 4000 Series products. The Lifetime Hardware Warranty Offer includes complimentary next-business-day shipment of replacement units for the life of the product (including fans and power supplies) and technical support as follows: Basic technical support for the supported lifecycle of the product and full technical support for the first 90 days after purchase. Products sold on or after July 1, 2015 are supported by the Lifetime Software Warranty Offer. This provides our Customers with access to software if and when published, so that the product's conformity to published specifications and capabilities may be maintained. For products sold prior to July 1, 2015, Extreme also offers a very cost-effective option to purchase the Software Release Service, providing access to new feature releases and additional hardware support programs. Detailed information on Extreme's Lifetime Warranty Offers is available [online](#).

Summary

Extreme is positioned to provide an end-to-end solution for today's converged networks and for tomorrow's networks. The Ethernet Routing Switch 4000 Series, along with other Extreme products, can increase profitability and productivity, streamline business operations, lower costs and help your business gain a competitive edge.

Ordering Information

ERS 4800 Series Models

Part Number	Description
AL4800A79-E6	ERS 4826GTS featuring 24 10/100/1000BASE-T ports, including 2 Combo SFP Uplink ports, plus 2 additional SFP+ Uplink ports
AL4800A89-E6	ERS 4826GTS-PWR+ featuring 24 10/100/1000BASE-T ports supporting 802.3at PoE+, including 2 Combo SFP Uplink ports, plus 2 additional SFP+ Uplink ports
AL4580A78-E6	ERS 4850GTS featuring 48 10/100/1000BASE-T ports, including 2 Combo SFP Uplink ports, plus 2 additional SFP+ Uplink ports
AL4800A88-E6	ERS 4850GTS-PWR+ featuring 48 10/100/1000BASE-T ports supporting 802.3at PoE+, including 2 Combo SFP Uplink ports, plus 2 additional SFP+ Uplink ports

Notes

- Each Switch ships with the Base Software License, which includes support for Extreme Fabric services, a 46 cm Stackable Chassis cable and 1 field-replaceable 300W PSU (for non-powered devices) and one field-replaceable 1000W PSU (for powered devices).
- Power cord is not included and must be ordered separately. For a list of available power cords, please refer to "Lifecycle Notification on ERS Power Cord Models" at: <http://bit.ly/2Gz2csk>

Power Supplies for ERS 4800 Models

Part Number	Description
AL1905A21-E6	1000W AC PoE+ Power Supply. For use in ERS 4000 PWR+ models
AL1905A08-E5	300W AC Power Supply. For use in the ERS 4826GTS, 4850GTS and WL8180, WL8180-16L wireless controller

Software

Part Number	Description
AL4516001	Advanced License for 1 Switch/Stackable Chassis (enables OSPF, VRRP and ECMP)
AL4516002	Advanced License for up to 10 Switches/Stackable Chassis (enables OSPF, VRRP and ECMP)
