

Developing a Water Management Plan

Stay ahead of emerging regulations by partnering with ChemTreat

Building Water Systems have become the subject of continued changes in regulations and best practices in recent years. As building owners and facility managers are challenged to keep up, ChemTreat can be a valued partner in navigating this dynamic environment.

How can ChemTreat help?

Minimizing the legionellosis risk associated with building water systems is a primary concern for some hospitals, hotels, and commercial buildings. The CDC recommends the development and implementation of a Water Management Plan to minimize the spread of legionellosis. At least one state now requires them for all building owners, and the Center for Medicare and Medicaid Services requires plans for its participating hospitals. ChemTreat can offer expert guidance and support to help facilities develop and execute Water Management Plans that comply with the ANSI/ASHRAE Standard 188-2018:

Identify Internal Water Management Plan Team

Conduct Site Surveys

Generate System Descriptions & Flow Diagrams

Establish Control Measures & Corrective Actions

Create Verification & Validation Procedures

Build Necessary Documentation

Benefits of Partnering with ChemTreat

Successful Water Management Plan implementation must be driven internally, but the development of a comprehensive plan poses a challenge facilities should not have to navigate alone. By trusting in ChemTreat, you gain a partner with a global service team that can:

- Ensure the documented plan is compliant with CMS and other regulatory requirements
- Provide the on-site support of a seasoned expert to assess your systems and can assist with not only testing, but all other water treatment issues at your facility
