

Metallic® SaaS Security & Compliance Overview

Built on industry-leading Commvault® technology with the power of Microsoft Azure, Metallic offers a multi-layered approach to data protection and security. With built-in hardened security protocols such as multifactor authentication, advanced data encryption, and zero-trust user access controls, Metallic prevents unwarranted access to systems and data. Data backup data copies are also stored in isolated and virtually air-gapped locations outside of source data, ensuring backups are immutable, highly available, and safe from malicious attack.

Metallic meets the most stringent confidentiality, integrity, and availability standards set by government agencies and enterprises alike, along with applicable compliance certifications, so our partners and customers leverage our services with confidence.

PCI Certified

Metallic and GDPR Compliance

Metallic is committed to supporting our customers' compliance with GDPR, and prioritizes the privacy and security of the data we protect with our entire product suite. When Metallic provides services to our customers as a data processor on their behalf, we will ensure that we comply with the specific requirements for data processors. When we appoint third parties to act as sub-processors, we'll also ensure that we have appropriate terms in place to comply with the GDPR and safeguard customers' data.
